

**LDVEH** is a mobile application developed using React Native (with Expo) and a Symfony backend. It allows users to interactively explore gamebooks ("Livre Dont Vous Êtes le Héros") by creating a character and making decisions that influence the story's progression.

The backend exposes a secure REST API protected by JWT tokens and handles all the business logic, such as navigation, combat, and user progression. It also includes an admin panel for managing books, pages, and characters.

The mobile frontend follows a modular architecture and uses Zustand for state management, ensuring smooth user sessions and a responsive UI across Android and iOS.

The project includes tests, API documentation (via Swagger), and is partially deployed using Scalingo for the backend. It aims to provide an immersive, narrative-driven experience with a clean and scalable architecture.
